WEB TECHNOLOGY – ASSIGNMENT II

Course Code: U21CS501

Project Title

Student Admission & Profile Management Portal

Submitted by

Laksitha S
Roll No: 24CS105
B.E CSE

Academic Year

2026–2027

QUESTION 1 – Student Registration Form (8 Marks)

Aim

To create a student registration form using HTML, CSS and JavaScript with form validation.

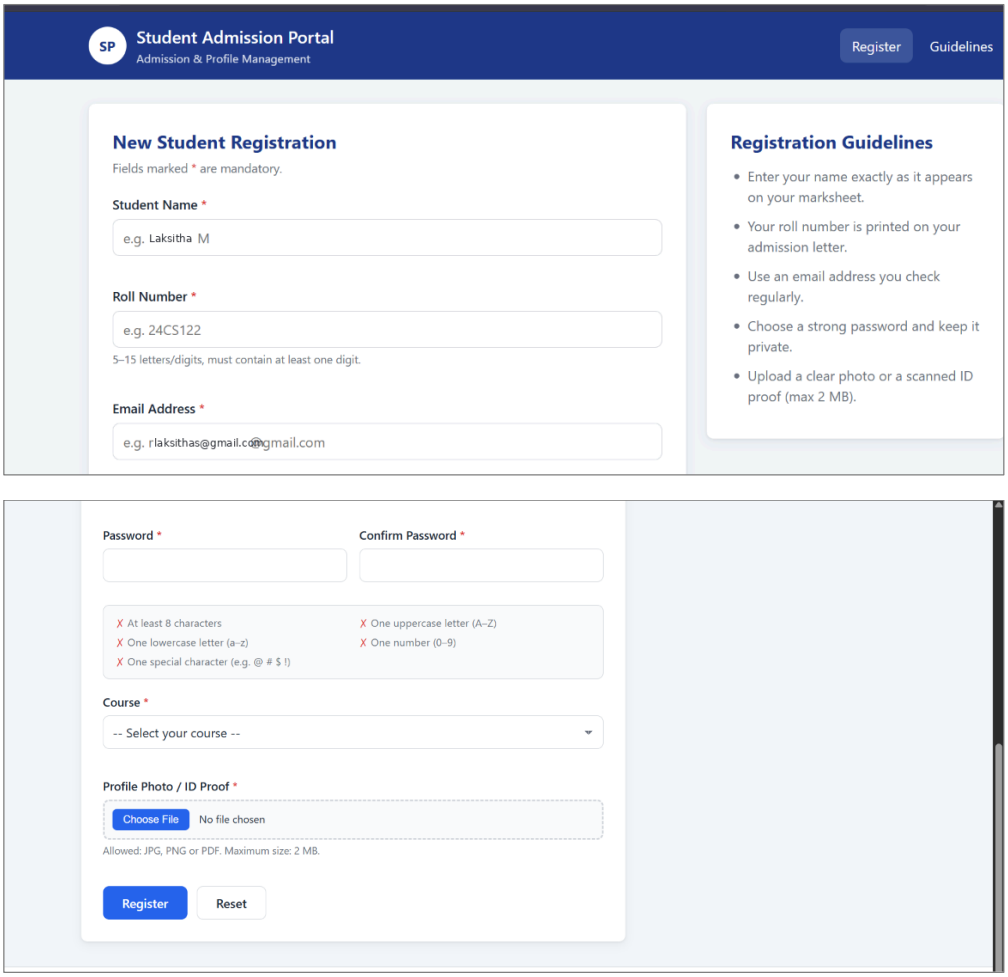

Implementation

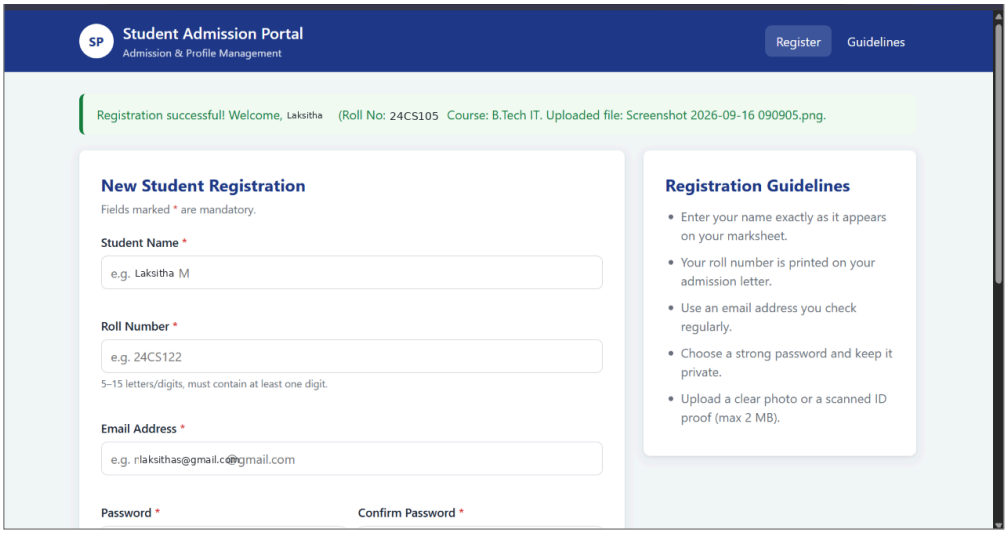

I created the form using HTML and styled it using CSS. JavaScript checks the required fields, email, password, course and uploaded file. Error messages are shown when the entered details are not valid.

Code Explanation

HTML contains the form fields and JavaScript performs the validation. Comments are included in the source files to explain the important parts.

Output

Result

The registration form was created with responsive design and JavaScript validation.

QUESTION 2 – PHP & MySQL Admin Panel (16 Marks)

Aim

To manage student details and file uploads using PHP and MySQL.

Implementation

I used PHP and MySQL to store and manage student details. The admin panel supports add, view, edit and delete operations.

CRUD Operations

- **Create** – Adds a student.
- **Read** – Shows student details.
- **Update** – Edits student details.
- **Delete** – Removes a student.

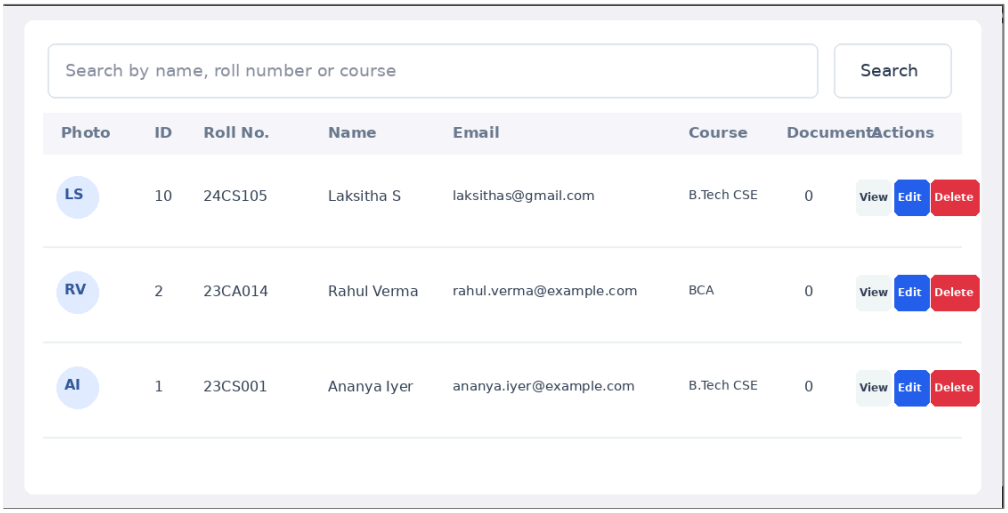

File Upload

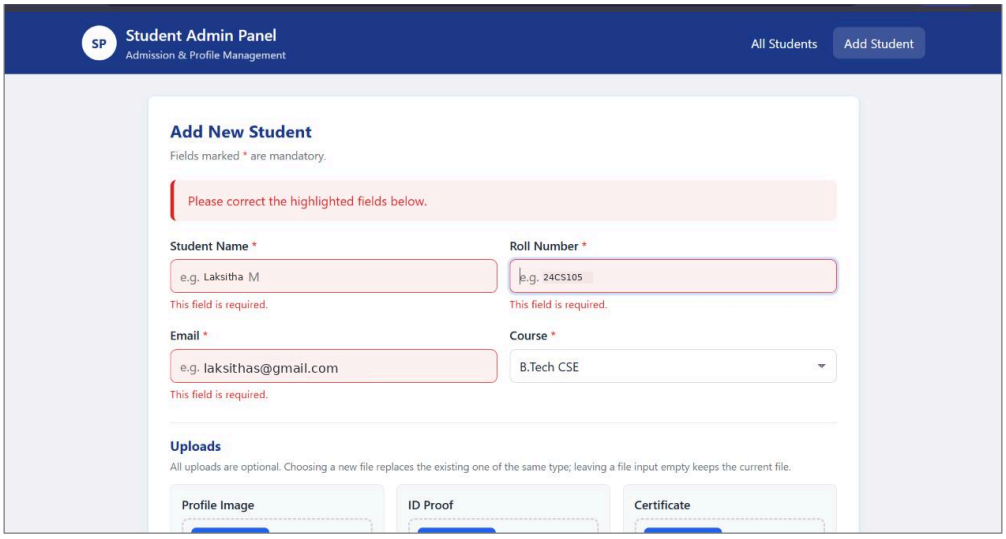

Profile images and documents can be uploaded. The file type and size are checked, and the file details are stored in the student_files table.

Code Explanation

PHP files handle the database connection, CRUD operations and file uploads. Inline comments are included in the source files.

Output

Result

The PHP and MySQL admin panel was created with CRUD and file upload features.

QUESTION 3 – Servlet, JSP & JDBC (16 Marks)

Aim

To display student details from MySQL using Servlet, JSP and JDBC with login protection.

Implementation

JDBC connects the Servlet project to MySQL. Student details are fetched from the database and displayed on the JSP page.

JDBC / Servlet / JSP

StudentServlet gets the student data and sends it to JSP. The JSP page displays the students and their available files.

FileServlet

FileServlet is used to display uploaded images and documents.

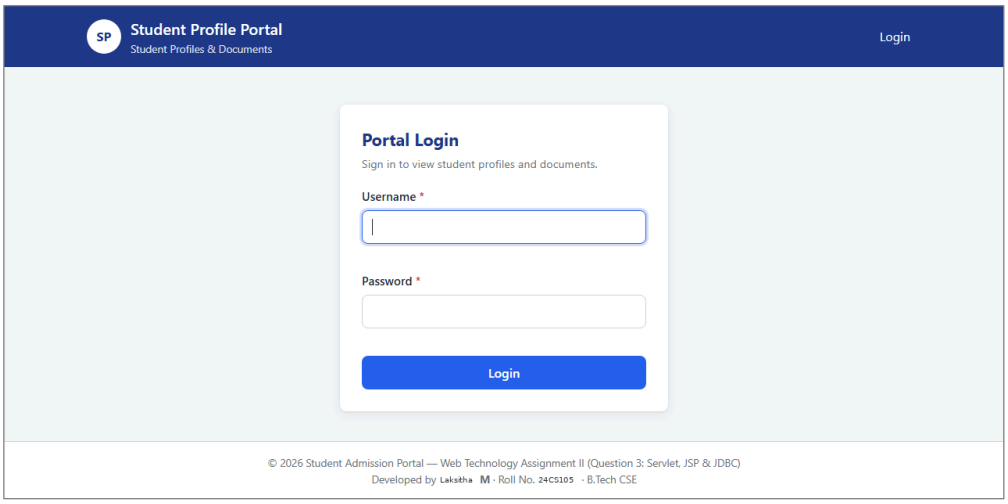

Session Handling

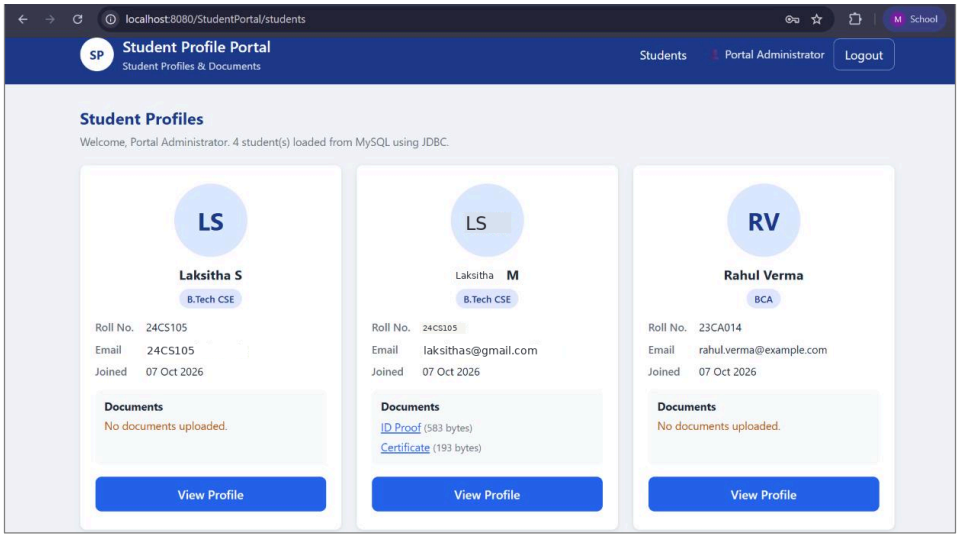

HttpSession keeps the user logged in. Users must log in before opening protected pages, and logout ends the session.

Code Explanation

Java and JSP files contain the JDBC, Servlet, file and session logic. Inline comments are included in the source files.

Output

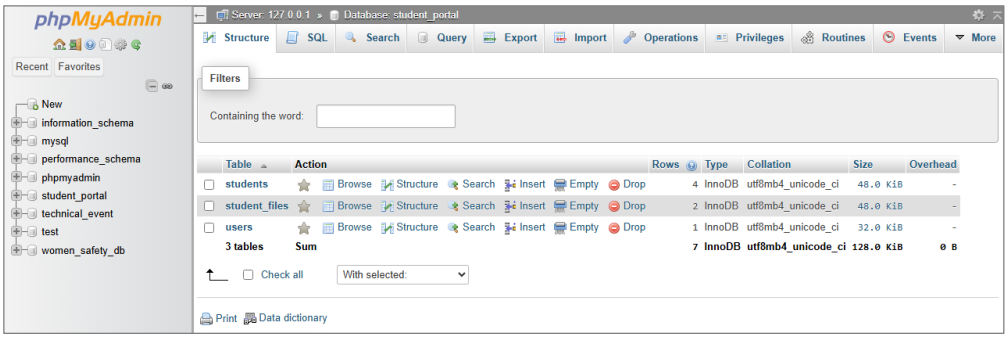

Result

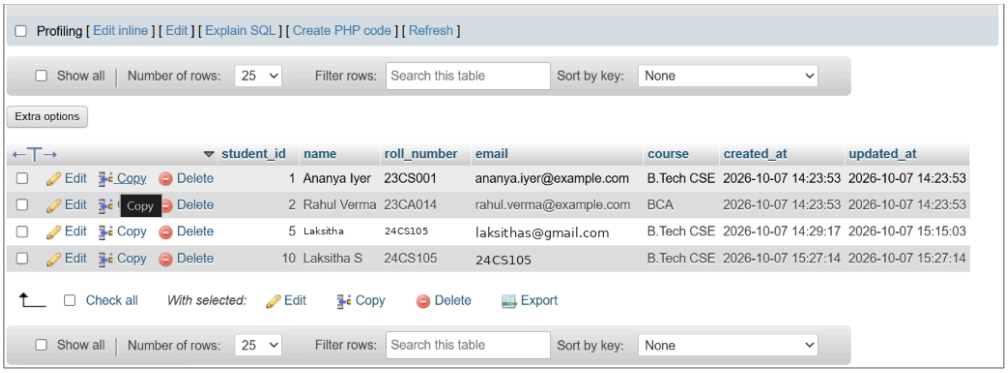

The Servlet and JSP portal displays student data from MySQL using JDBC and supports login sessions.

Database Schema

The database used is student_portal. The schema is available in database/student_portal.sql.

- **students** – Stores student details.
- **student_files** – Stores uploaded file details.
- **users** – Stores login details.

Conclusion

Through this assignment, I learned to create and validate web forms. I used PHP and MySQL to manage student records and Servlet, JSP and JDBC to display database data. This helped me understand how front end, backend and database work together.
